The summary table was very helpful.

Is  $y$  a background rate (assumed or calculated) or some other added constant?

Is the Latency term equal to the participants age in the study? or time since first exposure?

UC reports that one individual had an incorrect age in the spreadsheet. I will forward the information.

If we proceed with model 6 or 6a, will I get a point of departure in fibers-yr/cc or will have an age term mixed in?
